

Data Protection Impact Assessment – EMIS Health

A data processor acting on our behalf, EMIS Health, is changing certain technical aspects of the way in which it delivers services to us (see <https://www.emisnug.org.uk/blog/next-generation-emis-x-announced>), and as part of this transition it will be moving the data which it hosts on our behalf from its own data centre to a third party data centre, which is owned and operated by Amazon Web Services (**AWS**).

Delivery of the services is subject to the terms of the GP Systems of Choice Framework (**GPSOC**) which is managed by NHS Digital on behalf of the Secretary of State for Health.

The exercise will involve a change to the manner in which data is being processed on our behalf. Although this change does not introduce processing that is likely to result in a high risk to individuals (which would necessitate the undertaking of a DPIA), given that the data includes special category data we nevertheless feel that it is appropriate that we undertake a review.

As detailed above, the data (which includes special category data (i.e. health data) which is collected via the processor's clinical IT system and which forms the patient's medical record) will be stored in a third party data centre (which will act on the instructions of EMIS Health, who in turn will act in accordance with instructions received from (or on behalf of) ourselves as the relevant controller pursuant to our call off contract under the GPSOC framework or as otherwise documented).

Aside from the manner in which the data is being hosted, we have not identified, as part of this change, any material change to the manner in which the data is being processed (in terms of data sharing and/or use).

The scope of the data processing is as detailed in the relevant GP Systems of Choice contract (and related call off contract (and deed of undertaking)) or as otherwise agreed in writing between EMIS Health and ourselves.

As noted above, aside from the hosting element the manner in which the data is being used or otherwise processed will not materially change as a result of this change.

This DPIA distinguishes between: (i) the day to day processing undertaken (by us as a controller and EMIS Health as a processor acting on our behalf (and which will not change and so is not covered in detail)); and (ii) the change to the manner in which the data is being hosted by or on behalf of the processor (and which is the focus of this DPIA).

We are aware that cloud computing is an established technology and the adoption of which is something which is being driven within the public sector – <https://www.gov.uk/guidance/use-cloud-first>

The use of cloud computing has been recognised by the Government as being beneficial because:

- you can avoid upfront investments in your infrastructure, reducing overall costs;
- there's greater flexibility to trial new services or make changes, with minimal cost;

- pricing models are scaleable - instead of building for the maximum usage you buy for less usage and increase or decrease as appropriate;
- it will be easier to meet the Greening Government Commitments - cloud facilities typically try to use server space and power in the most efficient way possible;
- upgrades and security patches can be applied continuously; and
- the supplier will have responsibility for making sure the service has good availability for users.

In terms of issues of public concern, we understand that individuals may have an issue with their medical record being held by a commercial organisation but, the fact is that the relevant patient records are already being held by third party commercial organisations (either EMIS or one of the other primary system suppliers under GPSoC (or by sub-processors acting on their behalf)) and the only real change here is the identity of the third party (i.e. the data is moving from a processor to a sub-processor).

With regard to questions of security we are aware that the National Cyber Security Centre has issued guidance on cloud security - <https://www.ncsc.gov.uk/collection/cloud-security> and we understand that the relevant service provider in this instance (AWS) operates at the very highest levels of security (details of which are set out at <https://aws.amazon.com/security/>).

As noted under the question above, the move to a third party cloud environment is seen as beneficial for a number of reasons for us as a controller (in terms of improved availability, resilience and service in respect of the services being delivered to us by the processor) and in respect of the patients (in terms security, integrity and availability of their data).

The GPSoC services are provided pursuant to a framework agreement as between NHS Digital and EMIS Health (with services then being purchased at a CCG level on our behalf as a service recipient).

Under the terms of the GPSoC framework, NHS Digital essentially acts for and on our behalf in terms of approving the appointment of processors to the framework and, once they are appointed, the use of any sub-contractors (and so sub-processors). We understand that EMIS Health has engaged with NHS Digital in order to secure a variation to the framework agreement to provide for the appointment of AWS as an approved material sub-contractor.

EMIS Health has notified the relevant GP practices, including ourselves, so that we have an opportunity to raise any concerns with regard to the proposed change but as this change is a universal technical/operational change it is more appropriate for such matters to take place at a framework level (which is why the GPSOC Framework Agreement is structured as it is).

In any event, the Guidance issued by the ICO would suggest that this is a move which the processor is entitled to drive on its own behalf provided that it remains within the scope of the relevant contract (i.e. in its Controller/Processor detailed guidance the ICO states "*In certain circumstances, and where allowed for in the contract, a processor may have the freedom to use its technical knowledge to decide how to carry out certain activities on the controller's behalf.*").

The lawful basis for processing (a mixture of consent, explicit consent, fulfilling public duties and providing direct healthcare) the patient records does not change as a result of this proposed change, the only difference is a technical one in terms of how the services is being delivered by the relevant processor (i.e. EMIS Health).

We have in place a privacy notice which refers to the use of third party processors/service providers, which would include EMIS Health.

We are informed that the data will **not** be transferred overseas in connection with this change of service.

The processing which is undertaken by EMIS Health on our behalf is governed by the terms of the GP Systems of Choice Framework Agreement (together with the relevant Call Off Contract) which includes broad data protection obligations and we are able to directly enforce those obligations against the processor pursuant to a deed of undertaking which has been signed by EMIS Health and which each individual practice can rely upon.

<i>Risk</i>	<i>Options to reduce or eliminate risk</i>	<i>Effect on risk</i>	<i>Residual Risk</i>	<i>Measure approved</i>
Loss of data in the transfer of data to the sub-processor	We are informed that the data will be transferred in a very secure manner and in any event EMIS Health will retain a copy of the data in its current hosting centre unless or until there is evidence that all of the relevant data has been transferred.	[Reduced]	[Low]	[]
Misuse of data by the sub-processor	We are informed that the way in which the AWS service operates means that there is no opportunity for AWS employees to access or view the data held within the EMIS Health allocated areas of the hosting service. The data will be encrypted both at rest and in transit and AWS will not have access to the encryption keys. See https://aws.amazon.com/security/ for further details. AWS already provides numerous services to Governmental organisations (such as Crown Commercial Services and the Ministry of Justice (see - https://aws.amazon.com/solutions/case-studies/uk-moj/) who will have undertaken their own detailed assessments.	[Reduced]	[Low]	[]

Summary of DPO advice
[From the information provided by EMIS Health, we are satisfied that the security; availability; integrity and confidentiality, of the patient data will improve as a result of the move to the AWS data service.
As noted above, the ICO guidance states that a processor has the ability to decide certain technical aspects of the processing, including “how the data is stored”. This change does not affect the underlying processing and the manner in which the processing is controlled by the practice (either directly or indirectly via NHS Digital) and from the practice’s and patient’s perspective nothing will change as a result of this technical/background switch.]
